

LUNA PLASTER AFTERCARE

Below is a list of guidelines, which when followed will ensure LUNA PLASTER surfaces perform as intended.

HYDRO PLASTER

Curing

- The full chemical cure / crosslink of the DUO SEALER can take up to 30 days to complete depending on atmospheric temperatures. During this time extra care should be taken to protect the surface from heavy traffic and abrasion.
- No water should contact the surface for the first 7 days after application.
- Strictly no chemicals or cleaning agents should contact the HYDRO PLASTER during these 30 days.

Cleaning

- To avoid soiling of the polyurethane sealers, a periodic cleaning schedule should be undertaken.
- Strictly no harsh abrasive cleaners to be used on finished surfaces. LUNA PLASTER Eco Cleaner (natural cleaner based on plant oils) and LUNA PLASTER Multipurpose Cleaner should be used for everyday cleaning when required. Other brands of PH neutral cleaner can also be used. Bleach is not recommended.
- LUNA PLASTER Stain Remover should be used on particularly stubborn stains such as makeup or dye. The 'Pink Stuff' cleaner is also very efficient in removing stubborn stains.
- Do not use washing up liquid as a regular cleaning routine on any HYDRO PLASTER surface.

Underfloor Heating

- When commissioning a new underfloor heating system, the temperature should be brought up slowly over a period of days. A maximum of 3°C increase per day.
- To help prevent cracking, rapid changes in temperature and thermal shock should always be avoided.

General Care

- If LUNA PLASTER Renovator (sacrificial surface dressing) has been applied on top of the DUO SEALER (strongly advised) this should be maintained periodically to aid the protection and abrasion resistance of the surface.
- Steam cleaners can be used with caution on.
- Strong dyes and pigments (hair dye and fake tanning products) should not contact LUNA PLASTER surfaces.
- Sharp items or point loading should always be avoided. Felt pads or sliders should be added to all furniture feet.

ROCK PLASTER

Curing

- The full chemical cure / crosslink of the DUO SEALER can take up to 30 days to complete depending on atmospheric temperatures. During this time extra care should be taken to protect the surface from heavy traffic and abrasion.
- No water should contact the surface for the first 7 days after application.
- Strictly no chemicals or cleaning agents should contact the plaster during these 30 days.

Cleaning

- To avoid soiling of the polyurethane sealers, a periodic cleaning schedule should be undertaken.
- If sealed with MONO SEALER, only gentle cleaning recommended.
- Strictly no harsh abrasive cleaners to be used on finished surfaces. LUNA PLASTER Eco Cleaner (natural cleaner based on plant oils) and LUNA PLASTER Multipurpose Cleaner should be used for everyday cleaning when required. Other brands of PH neutral cleaner can also be used. The 'Pink Stuff' cleaner is also very efficient in removing stubborn stains.
- Do not use washing up liquid as a regular cleaning routine on any ROCK PLASTER surface.

General Care

- If LUNA PLASTER Renovator (sacrificial surface dressing) has been applied on top of the DUO SEALER (strongly advised) this should be maintained periodically to aid the protection and abrasion resistance of the Plaster.
- No steam cleaners should be used on ROCK PLASTER.
- Strong dyes and pigments (hair dye and fake tanning products) should not contact ROCK PLASTER surfaces.

EARTH PLASTER

EARTH PLASTER requires no aftercare. Cleaning chemicals cannot be used on EARTH PLASTER as this will damage the surface.

For further guidance or queries regarding aftercare please contact LUNA PLASTER at info@lunaplaster.co.uk
